Outdoor - Before

Outdoor - After

The white-paper ROI gray-balancing markedly reduces color casts. For the outdoor image, it corrects the sky and grass tint, making the overall scene appear whiter. For the indoor image, it removes the yellowish light from the paper. I think the algorithm is very useful since it successfully makes the images look whiter. However, the reference is crucial for the algorithm to work; it can be unreliable if the reference is not truly white or is unevenly lit.
